

Testing for Parasites

You can test for parasites in different ways such as stool, blood, MRI, CT scans and surgical procedures. Yet not one test for parasites is always reliable. The most common test that's done is either stool or blood even though it's not always detected. Same thing applies when testing for parasites in your animals.

Here's an example of someone testing for parasites: A patient sent in a stool sample to the most commonly used lab in L.A. who reported no parasites. A week later, the same patient sent a sample to one of the top labs in the U.S. and they found 3 different types. Not long after, the patient decided to do a cleanse that dislodged long threads of worms. Neither lab located that type of parasite.

Our planet is full of parasites, so it's good to do a yearly program to get rid of them in case they are present. Natural remedies reduce the need for expensive tests. As part of my in-office treatment, I routinely test for parasites and the natural, non-toxic remedies that will destroy them.

Come on in or call to schedule a free consultation visit to discuss and get tested for parasites.

Yours for health naturally,

Dr B
